10   ABSTRACT OF THE DISCLOSURE

A filter server receives a request for data, and
in responses retrieves a rule set for a plurality of
partial filter adapters from a filter registry. A
15   filter is built using said rule set. The filter
includes a chain of said plurality of partial filter
adapters. Each partial filter adapter includes a
generic format independent interface. The generic
format independent interface is used in passing data
20   from one partial filter adapter in said plurality of
partial filter adapters to another partial filter
adapter in said plurality of partial filter adapters.
